

## Little Car BIG Install!

The Awesome Autotronics Demo Car

[Autotronics](#) is Livin' Loud in a tiny, **energy-saving** way. They've given a **smart car** a KICKER audio makeover, and now it's even more fun to drive! Autotronics of Leicester have loaded the car with a **2,200-watt system** comprising of six 6.5-inch [RS-Series](#) Speaker system pairs, two more sets of 5.25-inch [RS-Series](#) speaker systems, and then two 12-inch [CompVR](#) subwoofers and two more 10-inch [CompVRs](#) to shock everyone it passes. The speakers are driven by four DX300.2 amps and a couple of [ZX1000.1](#) subwoofer amps, creating the **ultimate KICKER sound**.

This **outrageous** system is fuelled by an Alpine source unit that **feeds signal** to a 30-band equalizer. The install features **Five 7-inch LCD** screens plus an additional pair that **raise and lower** on linear actuators in the trunk! A total **body renovation** makes this car truly unique.

"[Autotronics](#) has achieved **something of a first** in the smart, creating a single-seat, **center-driving** position with relocated steering column, heating system, and using a foot-pedal handbrake system," said **Neil Hunt** of **ME News** magazine. "The custom fiberglass dash houses the gear selector as well as the ignition. The whole install is **an incredible build** in fiberglass."

This car is as **good on the ears** as it is on economy, making driving it around town fun and **environmentally friendly**. Launched in spring 2009 at the **International Styling and Tuning Show** in England's Donington Park, the smart car was a main attraction. Catch the Smart Car at a show or on the showroom floor at Autotronics.
